Re: CUSTOMER NOTIFICATION

Dear Valued Customer,

On April 15, 2019, Trenton Municipal Utilities (TMU) received the official results from the Missouri Department of Natural Resources (MDNR) for the latest round of testing conducted at 40 Tier One locations. The tests were part of the continued effort to monitor lead levels in the drinking water. The results showed a reduction in lead levels, with the system meeting the Environmental Protection Agency's (EPA) 90<sup>th</sup> percentile action level of 15 parts per billion (ppb). Three of the 40 test locations registered above the action level, while the remaining 37 locations were below the action level.

Reduction of lead levels is the goal of the additional treatment process that was approved by MDNR and installed in November. TMU will continue to utilize this process and hopes to see further improvements during the next testing period.

TMU, in accordance with MDNR regulations, will continue to monitor and test the water quality of the system. All tested locations have been notified of these results.

TMU is working to maintain high quality water for our community and will continue to update the public throughout this process. A few simple tips that can reduce risk of exposure to lead in drinking water include; flushing water taps for one to two minutes, until feeling a significant change in the temperature before using the water for drinking or cooking, purchasing a home treatment device or using bottled water for cooking and drinking. If you have any questions, please call our water hotline number at (660) 234-9172.

Sincerely,

Ron Urton, PE  
City Administrator/Utility Director
